QEXORA – INTELLIGENT ACADEMIC MAPPING AND QUESTION PAPER GENERATION SYSTEM

ABSTRACT

In modern education systems, preparing question papers that align with academic outcome frameworks has become a major challenge for educators. Different types of institutions follow different outcome mapping standards. For example, engineering universities require questions to be mapped with **Course Outcomes (CO), Bloom's Taxonomy Levels (BL), Knowledge Categories (KC), and Program Indicators (PI)**, while arts and science colleges use parameters such as **Program Outcomes (PO) and Program Specific Outcomes (PSO)**. Similarly, schools follow learning outcome–based assessments. Managing these different mapping frameworks manually is complex, time-consuming, and prone to errors.

To address this challenge, this project proposes **Qexora – Intelligent Academic Mapping and Question Paper Generation System**, a web-based platform designed to automate both **academic mapping and question paper generation** for multiple types of educational institutions. The system allows users to select the institution type such as **Engineering, Arts and Science, or School**, and dynamically provides the appropriate academic mapping structure required for that institution.

Qexora maintains a **centralized digital question bank** where questions can be stored, categorized, and mapped with relevant academic parameters. The system also provides **ready-made question paper templates as well as customizable templates**, allowing faculty members to easily define exam structures, marks distribution, and question sections. Using intelligent selection logic, the system automatically generates well-balanced question papers based on the selected template and mapping requirements.

Additionally, the system can provide **outcome coverage analysis**, helping educators understand how well the generated question paper addresses different learning outcomes. This improves the quality and consistency of assessments while supporting Outcome-Based Education (OBE) standards.

By integrating **dynamic academic mapping, automated question selection, and template-based paper generation**, Qexora reduces the workload of educators, improves accuracy in outcome mapping, and provides a unified

solution for examination preparation across **engineering colleges, arts and science institutions, and schools**. The system therefore contributes to creating a more efficient, standardized, and intelligent approach to academic assessment management.

PROBLEM STATEMENT

In modern education systems, preparing question papers that follow **Outcome-Based Education (OBE)** standards has become increasingly complex for educators. Different types of institutions such as **engineering universities, arts and science colleges, and schools** follow different academic mapping frameworks to evaluate student learning outcomes. For example, engineering institutions require questions to be mapped with **Course Outcomes (CO), Bloom's Taxonomy Levels (BL), Knowledge Categories (KC), and Program Indicators (PI)**, while arts and science colleges follow mappings such as **Course Outcomes (CO), Program Outcomes (PO), and Program Specific Outcomes (PSO)**. Schools generally assess students based on **learning outcomes, chapter coverage, and difficulty levels**.

Currently, faculty members perform this academic mapping process **manually using spreadsheets or documents**, which is time-consuming, repetitive, and prone to human error. Teachers must carefully ensure that every question is properly mapped to the appropriate learning outcomes and cognitive levels while also maintaining balanced difficulty levels and adequate coverage of course outcomes. Managing these requirements becomes particularly difficult when preparing multiple examinations across different courses and institutions.

Another challenge is ensuring that generated question papers **maintain proper cognitive skill evaluation based on Bloom's taxonomy**, balanced distribution of difficulty levels, and equal coverage of course outcomes. Without a systematic approach, question papers may unintentionally emphasize only certain topics or cognitive levels, which can affect the fairness and effectiveness of student assessment.

Furthermore, institutions are required to measure **Course Outcome (CO) attainment** and provide evidence of outcome-based assessment for accreditation and quality assurance purposes. However, calculating attainment and analysing question coverage manually requires significant effort from faculty members.

Therefore, there is a need for a **smart and unified system** that can support different academic mapping standards, automate the mapping process, ensure balanced question paper generation, and provide analytical insights such as **CO attainment, outcome coverage, difficulty distribution, and cognitive skill**

evaluation. Such a system would significantly reduce faculty workload while improving the accuracy, consistency, and quality of academic assessments across **engineering colleges, arts and science institutions, and schools**.

EXISTING SYSTEM

In most educational institutions, the process of preparing question papers is primarily carried out using **manual or semi-digital methods**. Faculty members typically create question papers using word processing tools such as **Microsoft Word**, **Google Docs**, or similar document editors. Questions are collected from previous papers, textbooks, and personal notes, and then manually arranged into a question paper format. Although these tools assist in document creation, they do not provide specialized features for **academic outcome mapping or automated question selection**.

In the existing system, question banks are often stored in **separate files, spreadsheets, or printed documents**, making it difficult to organize, search, and manage questions efficiently. Faculty members must manually verify whether each question aligns with parameters such as **Course Outcomes (CO), Bloom's Taxonomy Levels (BL), Knowledge Categories (KC), and Program Indicators (PI)**. This process requires significant time and effort and increases the possibility of **human errors, duplication of questions, and inconsistent exam patterns**.

Additionally, there is usually **no centralized system** to manage question templates or ensure uniformity in exam formats across departments. Teachers often design their own paper structures, which may lead to **variations in difficulty level, marks distribution, and question structure**. As a result, maintaining consistency with **Outcome-Based Education (OBE)** standards becomes challenging.

Therefore, the current system is **time-consuming, less efficient, and prone to inconsistencies**, highlighting the need for a more advanced and automated solution for question paper generation.

PROPOSED SYSTEM

The proposed system, **Qexora – Intelligent Academic Mapping and Question Paper Generation System**, is a web-based platform designed to simplify and automate the process of question paper preparation while addressing the challenges of academic outcome mapping across different educational institutions. The system aims to support **engineering colleges, arts and science**

institutions, and schools by providing a unified framework for managing questions, academic mappings, and automated question paper generation.

In the proposed system, users can first select the **type of institution**, such as Engineering, Arts and Science, or School. Based on the selected institution, the system dynamically activates the appropriate **academic mapping framework**. For engineering institutions, the system supports mapping parameters such as **Course Outcomes (CO), Bloom's Taxonomy Levels (BL), Knowledge Categories (KC), and Program Indicators (PI)**. For arts and science colleges, the system provides mapping for **Course Outcomes (CO), Program Outcomes (PO), and Program Specific Outcomes (PSO)**. For schools, the system allows mapping based on **subjects, chapters, learning outcomes, and difficulty levels**.

The system maintains a **centralized digital question bank** where educators can store questions along with their associated academic mappings. To reduce manual effort, the platform can include an **AI-assisted mapping mechanism** that analyses the text of a question and suggests suitable Bloom's taxonomy levels and course outcomes based on predefined rules or keyword analysis. Faculty members can review and confirm these suggestions before storing the question in the database.

Qexora also provides **ready-made question paper templates as well as customizable templates** that allow teachers to define the structure of the exam, including sections, number of questions, marks allocation, and question types. Using intelligent selection logic, the system automatically generates question papers by selecting questions from the question bank while ensuring **balanced difficulty levels, coverage of all course outcomes, and proper cognitive skill evaluation based on Bloom's taxonomy**.

In addition to generating question papers, the system provides **analytical features** such as outcome coverage analysis and **Course Outcome (CO) attainment reports**, which help educators evaluate how effectively the exam measures different learning outcomes. These insights assist institutions in improving teaching strategies and maintaining compliance with academic quality standards.

By integrating **dynamic academic mapping, AI-assisted mapping suggestions, template-based question paper generation, and academic outcome analysis**, Qexora provides a comprehensive and intelligent solution for modern examination preparation. The proposed system reduces manual workload for educators, improves the accuracy of academic mapping, ensures balanced assessments, and supports standardized evaluation processes across multiple levels of education.

SYSTEM ARCHITECTURE

The **system architecture of Qexora** is designed using a **multi-layer web architecture** to efficiently manage academic mapping, question banks, intelligent question selection, and outcome analysis. The architecture ensures scalability, modularity, and support for multiple education systems such as **engineering, arts and science, and school education**.

The architecture consists of four main layers: **Presentation Layer, Application Layer, Intelligent Mapping Layer, and Data Layer**.

---

1. Presentation Layer (User Interface)

The **presentation layer** is the front-end interface through which users interact with the system. It allows faculty members, administrators, and staff to perform tasks such as logging into the system, adding questions, mapping academic parameters, selecting templates, and generating question papers.

This layer is designed using **HTML, CSS, and JavaScript** to provide a user-friendly and responsive interface. The interface enables users to easily manage the question bank, review mapping suggestions, preview generated question papers, and analyse outcome reports.

Main functions of this layer include:

- User login and authentication
- Institution type selection
- Question bank management interface
- Template selection and customization
- Question paper preview and export
- Academic analytics dashboard

---

2. Application Layer (System Logic)

The **application layer** handles the main business logic of the system. It processes user requests and manages the workflow for academic mapping, question selection, template processing, and question paper generation.

This layer is typically implemented using **backend technologies such as Python with Flask or similar frameworks**. It connects the user interface with the database and intelligent modules.

Major components in this layer include:

- **User Management Module** – manages authentication and user roles.
- **Question Bank Management Module** – allows adding, editing, and organizing questions.
- **Template Management Module** – manages ready-made and customizable question paper templates.
- **Institution Configuration Module** – activates different academic mapping frameworks based on institution type.
- **Question Paper Generation Module** – compiles questions into structured exam papers.

---

3. Intelligent Mapping & Analysis Layer

This layer is the **core innovation of Qexora**. It performs academic mapping assistance, intelligent question selection, and outcome analysis.

Academic Mapping Engine

This module dynamically handles different academic frameworks depending on the institution type.

Examples:

Engineering Institutions:

- Course Outcomes (CO)
- Bloom's Taxonomy Levels (BL)
- Knowledge Categories (KC)
- Program Indicators (PI)

Arts and Science Colleges:

- Course Outcomes (CO)
- Program Outcomes (PO)
- Program Specific Outcomes (PSO)

Schools:

- Subject
- Chapter
- Learning Outcome
- Difficulty Level

AI-Based Mapping Assistant

This module analyses the **text of questions** and automatically suggests:

- Bloom's taxonomy level
- Knowledge category
- Possible course outcome

The system uses keyword-based and rule-based natural language analysis to assist teachers in mapping questions quickly.

Smart Question Selection Engine

This module automatically selects questions from the question bank based on:

- Template requirements
- Academic mappings
- Difficulty distribution
- Course outcome coverage

The engine ensures that generated question papers maintain **balanced cognitive levels and topic coverage**.

Academic Analytics Module

This module generates analytical reports such as:

- Course Outcome coverage
- Bloom's level distribution
- Difficulty level distribution
- Course Outcome attainment analysis

These analytics help educators evaluate **teaching effectiveness and assessment quality**.

---

4. Data Layer (Database System)

The **data layer** stores all system data in a centralized database. It maintains structured information required for question paper generation and academic analysis.

Typical database collections/tables include:

- Users
- Institution Types
- Subjects and Courses
- Question Bank
- Academic Mapping Data (CO, BL, KC, PI, PO, PSO)
- Question Templates
- Generated Question Papers
- Outcome Analytics Reports

The database ensures secure storage and quick retrieval of information during question paper generation.

Overall System Workflow in the Architecture

1. Users access the system through the web interface.
2. The application layer processes the user request.
3. The user selects the institution type and academic mapping framework.
4. Questions are retrieved from the question bank with their mapped outcomes.
5. The intelligent mapping layer analyses and selects appropriate questions.
6. The template module formats the selected questions into a structured question paper.
7. The system generates academic analytics such as CO coverage and difficulty distribution.
8. The final question paper can be previewed and exported for examination use.

Advantages of This Architecture

- Supports **multiple education systems** (Engineering, Arts & Science, School)
- Enables **automatic academic mapping assistance**
- Ensures **balanced question paper generation**
- Provides **analytical insights for outcome-based education**
- Improves scalability and system maintainability

SYSTEM MODULES

The **Qexora system** is divided into several functional modules to efficiently manage academic mapping, question banks, template management, and intelligent question paper generation. Each module performs a specific function that contributes to the overall workflow of the system.

---

1. User Authentication and Management Module

This module manages the **registration, login, and access control** of users in the system. It ensures that only authorized users such as administrators and faculty members can access system functionalities.

Key functions include:

- User registration and login
- Role-based access (Admin, Faculty)
- User profile management
- Secure authentication and session management

This module ensures system security and controlled access to academic data.

---

2. Institution Configuration Module

This module allows users to select the **type of institution** such as Engineering College, Arts and Science College, or School. Based on the selected institution, the system automatically activates the appropriate **academic mapping framework**.

Examples:

Engineering Institutions:

- CO (Course Outcome)
- BL (Bloom's Taxonomy Level)
- KC (Knowledge Category)
- PI (Program Indicator)

Arts and Science Colleges:

- CO (Course Outcome)
- PO (Program Outcome)
- PSO (Program Specific Outcome)

Schools:

- Subject
- Chapter
- Learning Outcome
- Difficulty Level

This module enables the system to support **multiple education frameworks within a single platform**.

---

3. Question Bank Management Module

The question bank module manages the **storage and organization of questions** in the system. Faculty members can add, edit, delete, and categorize questions based on subjects, units, and difficulty levels.

Key functions include:

- Adding new questions
- Editing and deleting questions
- Categorizing questions by subject or unit
- Tagging questions with difficulty levels
- Storing questions with academic mappings

This centralized repository allows easy retrieval of questions during question paper generation.

---

4. Academic Mapping Module

This module enables users to **map questions with academic indicators** required by the selected institution type.

For engineering education, questions are mapped with:

- Course Outcomes (CO)
- Bloom's Taxonomy Levels (BL)
- Knowledge Categories (KC)
- Program Indicators (PI)

For arts and science colleges:

- Course Outcomes (CO)
- Program Outcomes (PO)
- Program Specific Outcomes (PSO)

For schools:

- Learning Outcomes
- Chapter coverage
- Difficulty level

This mapping ensures that generated question papers follow **Outcome-Based Education standards**.

---

5. AI-Based Mapping Assistant Module

This module assists faculty members by automatically suggesting **Bloom's taxonomy levels and course outcomes** based on the question text.

The system analyses action keywords in the question such as:

- Define, List → Remember
- Explain, Describe → Understand
- Apply, Solve → Apply
- Compare, Analyse → Analyse
- Design, Develop → Create

This reduces the manual workload involved in mapping questions.

---

6. Template Management Module

The template management module allows users to define the **structure of the question paper**.

The system provides:

- Ready-made templates based on institutional formats
- Custom template creation

Users can define:

- Sections (Part A, Part B, etc.)
- Number of questions
- Marks distribution
- Question types (short answer, long answer)

This module ensures consistent and standardized exam formats.

---

7. Smart Question Selection Module

This module automatically selects questions from the question bank based on:

- Academic mapping parameters
- Template structure
- Difficulty distribution
- Course outcome coverage

The module ensures that the generated paper maintains:

- Balanced difficulty levels
- Coverage of all course outcomes
- Proper cognitive skill evaluation

---

8. Question Paper Generation Module

This module compiles the selected questions into a **complete question paper format** based on the selected template.

Functions include:

- Organizing questions into sections
- Formatting exam structure
- Generating preview of question paper
- Exporting the paper in downloadable format

This module completes the automated paper generation process.

---

9. Academic Analytics and CO Attainment Module

This module generates analytical reports that help institutions evaluate the effectiveness of assessments.

The system can provide reports such as:

- Course Outcome coverage in the question paper
- Bloom's taxonomy distribution
- Difficulty level distribution
- Course Outcome attainment analysis

These analytics help institutions improve **teaching strategies and assessment quality**.

Summary of System Modules

The Qexora system consists of the following main modules:

1. User Authentication and Management
2. Institution Configuration Module
3. Question Bank Management
4. Academic Mapping Module
5. AI-Based Mapping Assistant
6. Template Management
7. Smart Question Selection Module
8. Question Paper Generation Module
9. Academic Analytics and CO Attainment Module

SYSTEM WORKFLOW

The **system workflow of Qexora** explains the sequence of steps involved in generating an academically mapped question paper. The workflow ensures that questions are properly stored, mapped to academic outcomes, and intelligently selected to produce a balanced and standardized examination paper.

Step 1: User Authentication

The workflow begins when the **user (faculty or administrator)** logs into the system using valid credentials. The authentication module verifies the user and grants access to system features such as question bank management, template creation, and question paper generation.

Step 2: Institution Type Selection

After logging in, the user selects the **type of institution** for which the question paper is being prepared. The system supports multiple education frameworks, including:

- **Engineering Colleges** – CO, BL, KC, PI mapping
- **Arts and Science Colleges** – CO, PO, PSO mapping
- **Schools** – Subject, Chapter, Learning Outcome, Difficulty Level

Based on the selected institution, the system activates the corresponding **academic mapping structure**.

Step 3: Question Bank Creation

The user adds questions to the **centralized question bank**. Each question is stored in the database with details such as:

- Subject
- Unit or chapter
- Marks allocation
- Difficulty level

This question bank acts as the primary repository for generating question papers.

Step 4: Academic Mapping of Questions

Once questions are added, they are **mapped with relevant academic parameters** based on the selected institution type.

Examples:

Engineering Institutions:

- Course Outcome (CO)
- Bloom's Taxonomy Level (BL)
- Knowledge Category (KC)
- Program Indicator (PI)

Arts and Science Colleges:

- Course Outcome (CO)
- Program Outcome (PO)
- Program Specific Outcome (PSO)

Schools:

- Learning Outcome
- Chapter coverage
- Difficulty level

Step 5: AI-Assisted Mapping Suggestion

To reduce manual effort, the system provides **AI-assisted mapping suggestions**. The system analyses the text of the question and suggests suitable **Bloom's taxonomy levels and possible course outcomes** based on keyword analysis. The faculty member can review and confirm these suggestions.

Step 6: Template Selection or Creation

The user selects a **question paper template** from the available ready-made templates or creates a **custom template**. The template defines the structure of the exam, including:

- Sections (Part A, Part B, etc.)
- Number of questions per section
- Marks distribution
- Question types

Step 7: Smart Question Selection

The system processes the template and automatically selects suitable questions from the question bank. The **smart selection engine** ensures that the generated paper maintains:

- Balanced difficulty levels
- Coverage of all course outcomes
- Proper cognitive skill evaluation based on Bloom's taxonomy

---

Step 8: Question Paper Generation

The selected questions are organized according to the template structure to generate a **complete question paper**. The system formats the questions into sections and prepares a structured exam paper.

Step 9: Academic Analytics and Validation

Before finalizing the paper, the system generates **analytical reports** that provide insights such as:

- Course Outcome coverage
- Bloom's taxonomy distribution
- Difficulty level distribution

These reports help ensure that the question paper meets academic and assessment standards.

Step 10: Preview, Export, and Storage

Finally, the generated question paper is displayed for **preview**. The user can review the content and export the paper in a downloadable format. The generated question paper and its academic mapping details are stored in the system database for future reference.

Summary of Workflow

The revised workflow ensures that Qexora not only generates question papers but also **maintains proper academic mapping, balanced difficulty levels, and outcome-based assessment standards**, making it a comprehensive solution for modern examination preparation across multiple educational institutions.

ADVANTAGES OF THE SYSTEM

The **Qexora system** provides several advantages over traditional methods of question paper preparation. By integrating academic mapping, intelligent question selection, and automated paper generation, the system improves the efficiency and quality of the examination preparation process.

---

1. Support for Multiple Education Systems

The system supports different academic frameworks used by **engineering colleges, arts and science institutions, and schools**. It dynamically adapts the academic mapping parameters according to the selected institution type, making the system flexible and widely applicable.

---

2. Automated Academic Mapping

The system allows questions to be mapped with important academic indicators such as **Course Outcomes (CO), Bloom's Taxonomy Levels (BL), Knowledge Categories (KC), Program Indicators (PI), Program Outcomes (PO), and Program Specific Outcomes (PSO)**. This ensures that question papers follow **Outcome-Based Education (OBE)** standards and accurately measure student learning outcomes.

3. AI-Assisted Mapping Suggestions

The system provides intelligent suggestions for **Bloom's taxonomy levels and course outcomes** by analysing the text of the question. This reduces the manual effort required from faculty members and improves the accuracy of the mapping process.

---

4. Balanced Difficulty Level Distribution

The system ensures that the generated question paper contains a **balanced distribution of easy, medium, and difficult questions**. This helps create fair and well-structured examinations.

---

5. Coverage of All Course Outcomes

During question paper generation, the system ensures that **all course outcomes are properly covered**. This guarantees that the examination evaluates all important topics and learning objectives of the course.

---

6. Proper Cognitive Skill Evaluation

By using **Bloom's taxonomy levels**, the system ensures that the question paper evaluates different cognitive skills such as remembering, understanding, applying, analyzing, and creating. This promotes a comprehensive assessment of student knowledge and problem-solving ability.

---

7. Centralized Question Bank Management

The system provides a **centralized digital repository** for storing and managing questions. Faculty members can easily add, update, categorize, and retrieve questions when generating question papers.

---

8. Standardized Question Paper Templates

The system provides **ready-made templates and customizable templates** that help maintain a consistent and professional format for question papers across different courses and departments.

---

9. Course Outcome Attainment Analysis

The system can generate reports that show **Course Outcome attainment and coverage** based on the questions included in the examination. These reports help institutions evaluate the effectiveness of teaching and learning processes.

---

10. Reduced Faculty Workload

Automation of academic mapping, question selection, and question paper generation significantly **reduces the workload of educators**, allowing them to focus more on teaching and academic activities.

---

11. Improved Accuracy and Consistency

The automated system reduces the chances of **human errors, question repetition, or improper marks distribution**, resulting in more accurate and reliable question papers.

---

12. Efficient Examination Preparation

By integrating question management, academic mapping, and paper generation into a single platform, the system simplifies the **entire examination preparation process** and improves institutional efficiency.

FUTURE ENHANCEMENTS

Although Qexora provides an effective solution for academic mapping and automated question paper generation, several advanced features can be added in the future to improve the system's intelligence, usability, and scalability.

---

1. Advanced AI-Based Question Generation

Future versions of the system can include **AI-based automatic question generation**, where the system can create new questions from study materials, textbooks, or uploaded documents using natural language processing techniques. This feature will help expand the question bank automatically.

---

2. Automatic Academic Mapping

The system can be enhanced to perform **fully automatic academic mapping** by analysing the content of the question and assigning appropriate **Course Outcomes (CO), Bloom's taxonomy levels, and other academic indicators** without requiring manual input from faculty members.

---

3. Integration with Learning Management Systems

The system can be integrated with popular Learning Management Systems such as **Moodle** and **Google Classroom**. This integration would allow automatic synchronization of courses, assessments, and student data.

---

4. Advanced Academic Analytics

Future versions of the system can include advanced **analytics dashboards** that provide detailed reports on outcome coverage, student performance, question difficulty analysis, and teaching effectiveness.

---

5. Secure Question Paper Management

Security features such as **question paper encryption, restricted access, and timed release of examination papers** can be implemented to prevent unauthorized access and ensure examination integrity.

---

6. Multi-Institution Support

The system can be expanded to support **multiple institutions on a single platform**, allowing universities or educational organizations to manage question banks and assessments for several colleges or departments.

---

7. Mobile Application Support

A **mobile application version** of Qexora can be developed to allow educators to manage questions, perform mapping, and generate question papers using smartphones or tablets.

---

8. Automated Question Quality Evaluation

Future improvements can include a **question quality analysis feature** that evaluates questions based on clarity, difficulty level, and alignment with learning outcomes to ensure high-quality assessments.

---

9. Cloud-Based Deployment

Deploying the system on **cloud platforms** will improve scalability, data security, and accessibility, allowing institutions to access the system from different locations with greater reliability.

---

10. Support for More Academic Frameworks

The system can be extended to support additional **educational standards and academic frameworks used by different universities and educational boards**, making the platform adaptable to a wider range of institutions.

CONCLUSION

The development of **Qexora – AI-Based Smart Question Paper Generator** provides an effective solution to the challenges faced in traditional question paper preparation. In many educational institutions, especially in engineering programs, question paper creation is a time-consuming and manual process that requires careful alignment with academic standards such as **Course Outcomes (CO), Bloom's Taxonomy Levels (BL), Knowledge Categories (KC), and Program Indicators (PI)**. Manual preparation often leads to inconsistencies, repetition of questions, and difficulty in maintaining proper outcome-based assessment.

The proposed web-based system automates the entire question paper generation process by maintaining a **centralized question bank**, enabling **engineering question mapping**, and providing **ready-made as well as customizable templates**. By integrating intelligent question selection mechanisms, the system ensures that generated question papers are balanced, structured, and aligned with Outcome-Based Education requirements.

Qexora significantly **reduces the workload of educators**, improves the accuracy of academic mapping, and ensures consistency in exam formats across institutions. The system also enhances efficiency in managing question repositories and generating question papers in a short period of time.

In conclusion, **Qexora serves as a smart, reliable, and scalable platform** that modernizes the examination preparation process. By combining **automation, web technology, and intelligent question selection**, the system contributes to improving the quality and efficiency of academic assessments in engineering education.
